Write a C program to simulate a Deterministic Finite Automata (DFA) for the given

language representing strings that start with a and end with a

AIM: To write a C program to simulate a Deterministic Finite Automaton (DFA) that accepts strings starting with a and ending with a.

CODE:

main.c

Run ▶

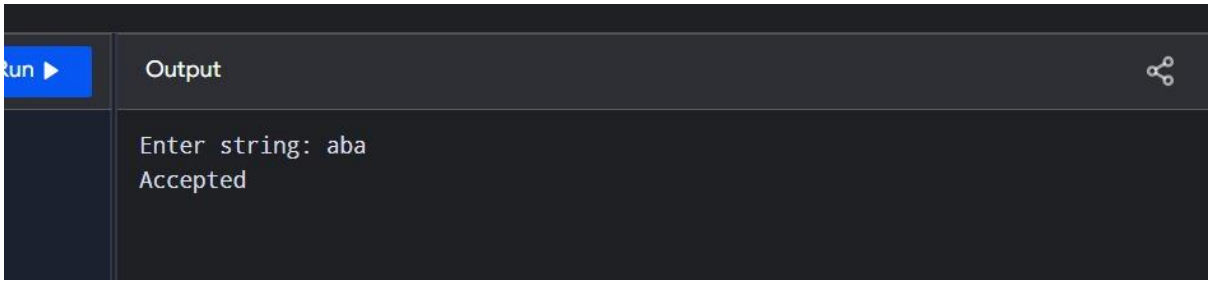

```c
#include <stdio.h>
#include <string.h>

int main() {
    char s[100];
    printf("Enter string: ");
    scanf("%s", s);

    if (s[0] == 'a' && s[strlen(s)-1] == 'a')
        printf("Accepted");
    else
        printf("Rejected");

    return 0;
}
```

Output:

RESULT: The program accepts strings that start with a and end with a; otherwise, it rejects them.
