TOC EXPERIMENTS 11-15

Exp 11:

Aim:

To calculate the ε-closure of each state in an NFA with ε-transitions.

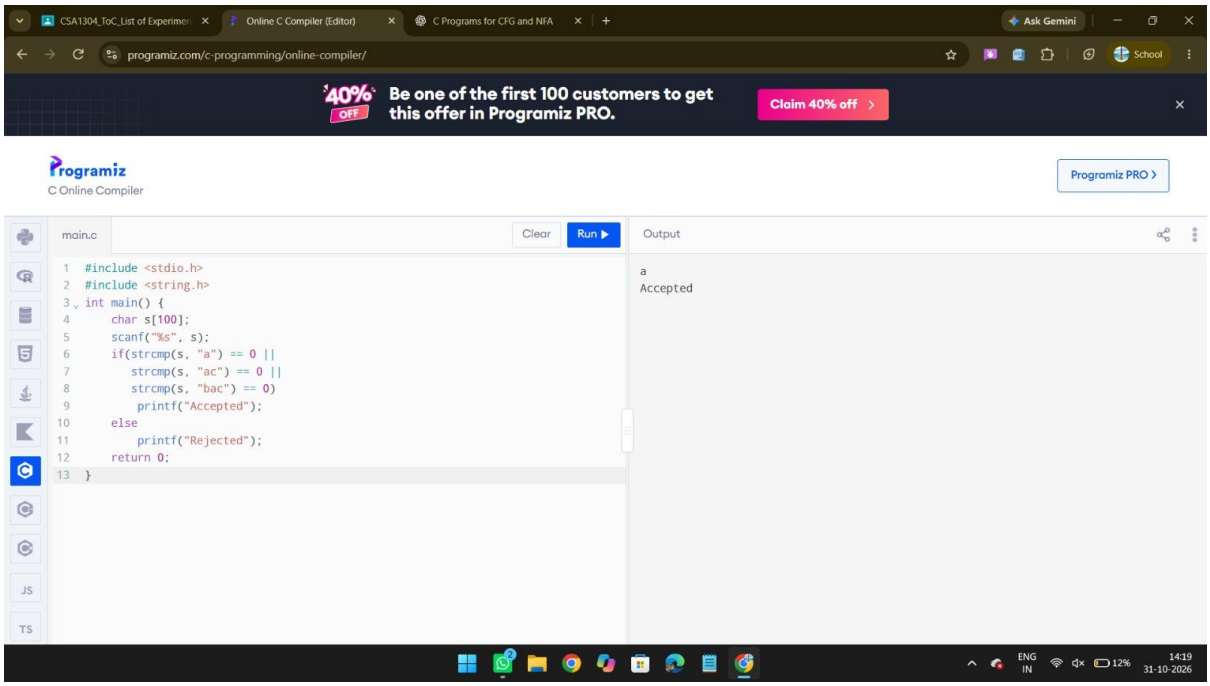

Result :

Thus, the ε-closure of all states was calculated successfully.

Exp 12:

Aim:

To design a DFA that accepts exactly the strings a, ac, and bac.

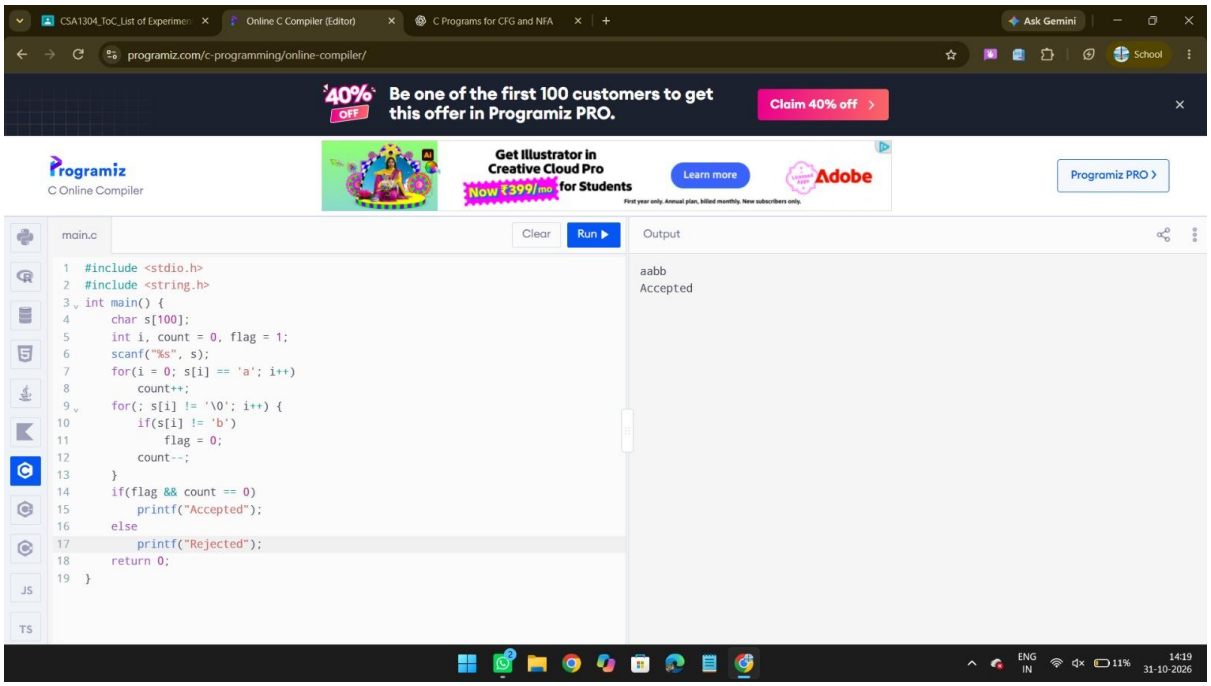

Result :

Thus, the DFA language was implemented successfully. The strings a, ac, and bac are accepted.

Exp 13:

Aim:

To simulate a PDA that accepts the string aabb by matching two a symbols with two b symbols.

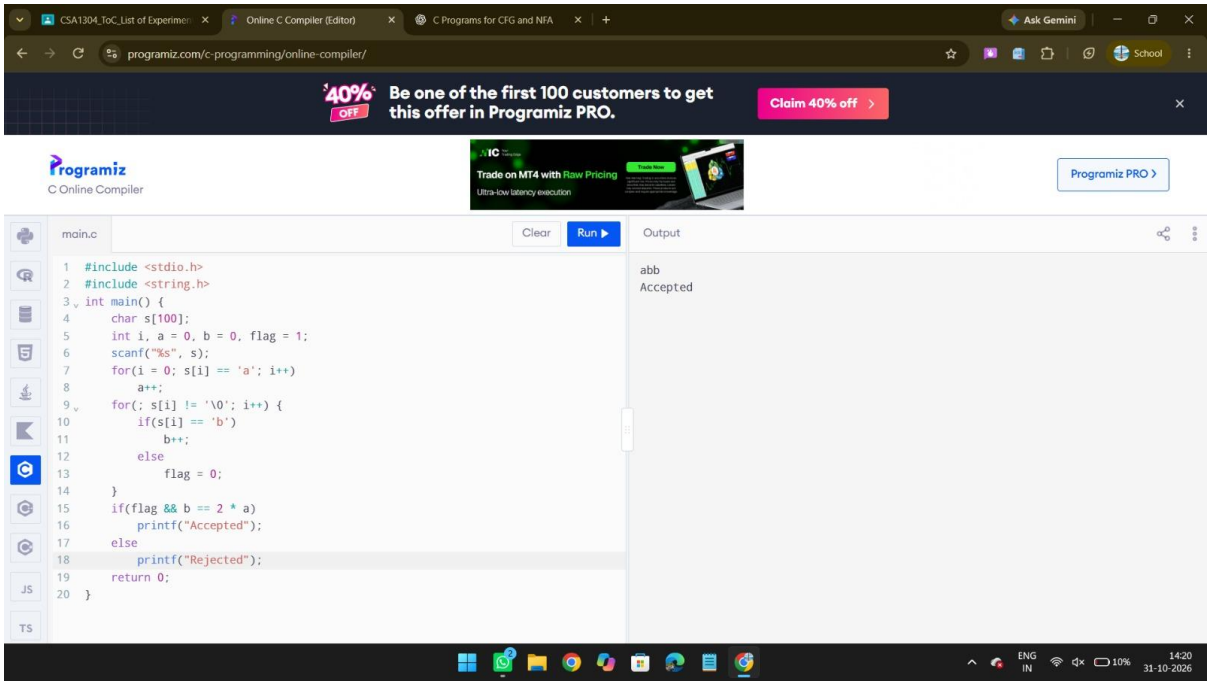

Result :

Thus, the PDA simulation was implemented successfully. The input aabb is accepted.

Exp 14 :

Aim :

To simulate a PDA that accepts strings containing n occurrences of a followed by 2n occurrences of b.

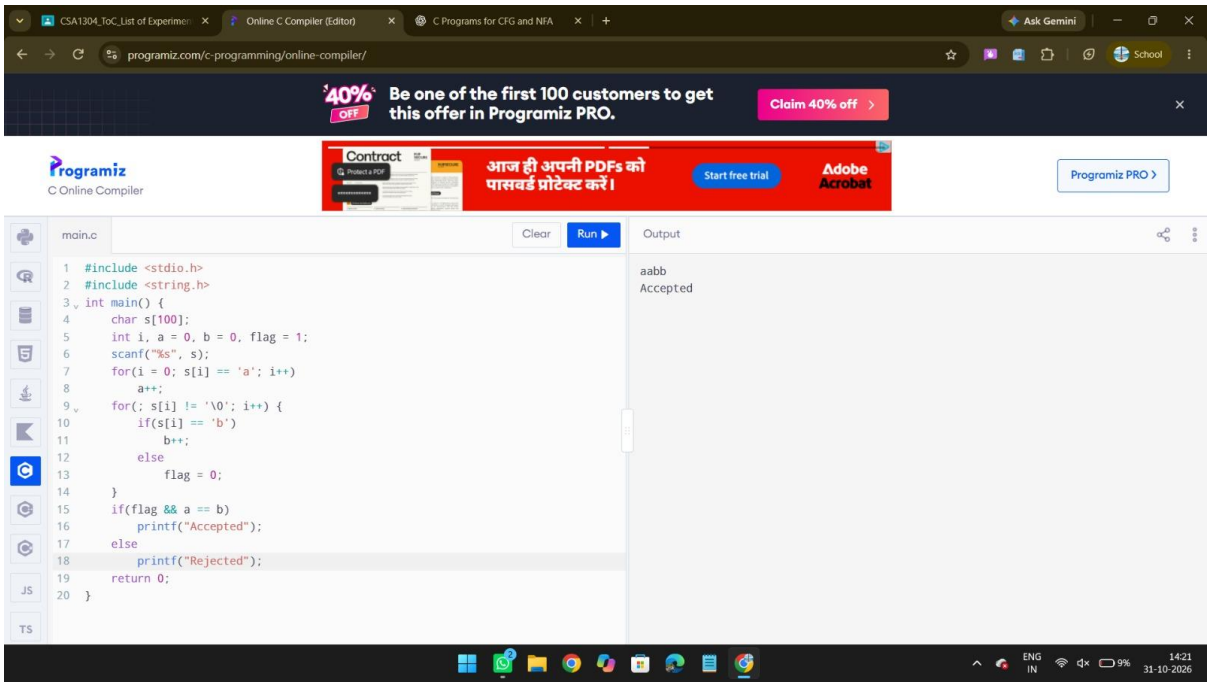

Result :

Thus, the PDA simulation was implemented successfully. For example, abb and aabbbb are accepted.

Exp 15 :

Aim :

To simulate a Turing Machine that accepts strings containing equal numbers of a symbols followed by b symbols.

Result :

Thus, the Turing Machine language was implemented successfully. For example, ab and aabb are accepted. Turing Machine language was implemented successfully. The strings abb and aabbbb are accepted.
